
Terralego Documentation

Release 0.1

Gagaro

Sep 27, 2017

Contents

1	Getting started	1
1.1	Geocoding	1
1.2	Geodirectory	2
2	Indices and tables	3
	Python Module Index	5

CHAPTER 1

Getting started

Install using pip:

```
pip install terralego
```

Set your credentials using the environment variables:

```
export TERRALEGO_USER="my_user"
export TERRALEGO_PASSWORD="my_password"
```

You can now use terralego:

```
from terralego import geocoding
results = geocoding.search('paris france')
```

Contents:

Geocoding

`terralego.geocoding.autocomplete(text, params=None)`
Autocomplete locations from a string.

Parameters

- **text** – The string which will be used to do the autocomplete.
- **params** – A dict including other get parameters.

Returns A geojson including the results.

`terralego.geocoding.reverse(lat, long, params=None)`
Search addresses from a location.

Parameters

- **lat** – The latitude of the location.
- **long** – The longitude of the location.
- **params** – A dict including other get parameters.

Returns A geojson including the results.

`terralego.geocoding.search(text, params=None)`

Search locations from a string.

Parameters

- **text** – The string which will be used to do the search.
- **params** – A dict including other get parameters.

Returns A geojson including the results.

Geodirectory

`terralego.geodirectory.create_entry(geometry, tags=None)`

Create a new entry.

Parameters

- **geometry** – A WKT string representing the geometry of the entry or a dict representing the geojson.
- **tags** – A list of string describing the entry. Can be used for filtering later on.

Returns A geojson describing the entry as a python dictionary.

`terralego.geodirectory.delete_entry(entry_id)`

Delete an entry.

Parameters `entry_id` – The id of the entry.

`terralego.geodirectory.get_entry(entry_id)`

Get an entry.

Parameters `entry_id` – The id of the entry.

Returns A geojson describing the entry as a python dictionary.

`terralego.geodirectory.update_entry(entry_id, geometry, tags=None)`

Update an entry.

Parameters

- **entry_id** – The id of the entry.
- **geometry** – A WKT string representing the geometry of the entry or a dict representing the geojson.
- **tags** – A list of string describing the entry. Can be used for filtering later on.

Returns A geojson describing the updated entry as a python dictionary.

CHAPTER 2

Indices and tables

- genindex
- modindex
- search

Python Module Index

t

`terralego.geocoding`, 1
`terralego.geodirectory`, 2

Index

A

autocomplete() (in module `terralego.geocoding`), [1](#)

C

create_entry() (in module `terralego.geodirectory`), [2](#)

D

delete_entry() (in module `terralego.geodirectory`), [2](#)

G

get_entry() (in module `terralego.geodirectory`), [2](#)

R

reverse() (in module `terralego.geocoding`), [1](#)

S

search() (in module `terralego.geocoding`), [2](#)

T

`terralego.geocoding` (module), [1](#)

`terralego.geodirectory` (module), [2](#)

U

update_entry() (in module `terralego.geodirectory`), [2](#)
